The edit distance between two graphs on the same labeled vertex set is defined to be the size of the symmetric difference of the edge sets, divided by $\binom{n}{\lfloor n / 2\rfloor}$. The edit distance function of a hereditary property $\mathcal{H}$ is a function of $p \in[0,1]$ that measures, in the limit, the maximum normalized edit distance between a graph of density $p$ and $\mathcal{H}$. It is also, again in the limit, the edit distance of the Erdős-Rényi random graph $G(n, p)$ from $\mathcal{H}$.

In this talk, we address the edit distance function for $\operatorname{Forb}(H)$, where $H=C_{h}^{t}$, the $t^{\text {th }}$ power of the cycle of length $h$. For $h \geq 2 t(t+1)+1$ and $h$ not divisible by $t+1$, we determine the function for all values of $p$. For $h \geq 2 t(t+1)+1$ and $h$ divisible by $t+1$, the function is obtained for all but small values of $p$. We also obtain some results for smaller values of $h$. (Received January 28, 2016)
