08854-8019. Normal generators for mapping class groups in the fibered cone. Preliminary report.

We show that for almost all primitive integral cohomology classes in the fibered cone of a closed fibered hyperbolic 3-manifold, the monodromy normally generates the mapping class group of the fiber. Key idea of the proof is to use Fried's theory of suspension flow and dynamic blow-up of Mosher. If the time permits, we also discuss the non-existence of the analogue of Fried's continuous extension of the normalized entropy over the fibered face in the case of asymptotic translation lengths on the curve complex.
