Abstract

This volume introduces equivariant homotopy, homology, and cohomology theory, along with various related topics in modern algebraic topology. It begins (Chapters I–VIII) with a development of the equivariant algebraic topology of spaces, culminating in a discussion of the Sullivan conjecture that emphasizes its relationship with classical Smith theory. It next (Chapters IX–XV) introduces equivariant stable homotopy theory, the equivariant stable category, and the most important examples of equivariant cohomology theories. The basic machinery that is needed to make serious use of equivariant stable homotopy theory is then presented (Chapters XVI–XXII), along with discussions of the Segal conjecture and generalized Tate cohomology. Finally (Chapters XXIII–XXVIII), the book gives an introduction to “brave new algebra”, which is the study of point-set level algebraic structures on spectra, and its equivariant applications. Emphasis is placed on equivariant complex cobordism, and some related material on that topic is presented in detail.

- I Equivariant cellular and homology theory
- II Postnikov systems, localization, and completion
- III Equivariant rational homotopy theory
- IV Smith theory
- V Categorical constructions; equivariant applications
- VI The homotopy theory of diagrams
- VII Equivariant bundle theory and classifying spaces
- VIII The Sullivan conjecture
- IX An introduction to equivariant stable homotopy
- X G -CW(V) complexes and $RO(G)$ -graded cohomology
- XI The equivariant Hurewicz and suspension theorems
- XII The equivariant stable homotopy category
- XIII $RO(G)$ -graded homology and cohomology theories
- XIV An introduction to equivariant K -theory
- XV An introduction to equivariant cobordism
- XVI Spectra and G -spectra; change of groups; duality
- XVII The Burnside ring
- XVIII Transfer maps in equivariant bundle theory
- XIX Stable homotopy and Mackey functors
- XX The Segal conjecture
- XXI Generalized Tate cohomology
- XXII Twisted half-smash products and function spectra
- XXIII Brave new algebra
- XXIV Brave new equivariant foundations
- XXV Brave new equivariant algebra

Contents

Introduction	1
Chapter I. Equivariant cellular and homology theory	11
1. Some basic definitions and adjunctions	11
2. Analogues for based G -spaces	12
3. G -CW complexes	13
4. Ordinary homology and cohomology theories	16
5. Obstruction theory	18
6. Universal coefficient spectral sequences	19
Chapter II. Postnikov systems, localization, and completion	21
1. Eilenberg-Mac Lane G -spaces and Postnikov systems	21
2. Summary: localizations of spaces	22
3. Localizations of G -spaces	23
4. Summary: completions of spaces	24
5. Completions of G -spaces	26
Chapter III. Equivariant rational homotopy theory (by Georgia Triantafillou)	27
1. Summary: the theory of minimal models	27
2. Equivariant minimal models	29
3. Rational equivariant Hopf spaces	31
Chapter IV. Smith theory	33
1. Smith theory via Bredon cohomology	33
2. Borel cohomology, localization, and Smith theory	35
Chapter V. Categorical constructions; equivariant applications	39
1. Coends and geometric realization	39
2. Homotopy colimits and limits	41
3. Elmendorf's theorem on diagrams of fixed point spaces	43
4. Eilenberg-Mac Lane G -spaces and universal \mathcal{F} -spaces	45
Chapter VI. The homotopy theory of diagrams (by Robert J. Piacenza)	47
1. Elementary homotopy theory of diagrams	47
2. Homotopy groups	49
3. Cellular theory	50
4. The homology and cohomology theory of diagrams	52
5. The closed model structure on \mathcal{U}^J	53
6. Another proof of Elmendorf's theorem	56
Chapter VII. Equivariant bundle theory and classifying spaces	59
1. The definition of equivariant bundles	59
2. The classification of equivariant bundles	60
3. Some examples of classifying spaces	62

Chapter VIII. The Sullivan conjecture	67
1. Statements of versions of the Sullivan conjecture	67
2. Algebraic preliminaries: Lannes' functors T and Fix	70
3. Lannes' generalization of the Sullivan conjecture	71
4. Sketch proof of Lannes' theorem	73
5. Maps between classifying spaces	75
Chapter IX. An introduction to equivariant stable homotopy	79
1. G -spheres in homotopy theory	79
2. G -Universes and stable G -maps	81
3. Euler characteristic and transfer G -maps	83
4. Mackey functors and coMackey functors	84
5. $RO(G)$ -graded homology and cohomology	86
6. The Conner conjecture	88
Chapter X. G-CW(V) complexes and $RO(G)$-graded cohomology (by Stefan Waner)	89
1. Motivation for cellular theories based on representations	89
2. G -CW(V) complexes	90
3. Homotopy theory of G -CW(V) complexes	92
4. Ordinary $RO(G)$ -graded homology and cohomology	94
Chapter XI. The equivariant Hurewicz and suspension theorems (by L. Guance Lewis, Jr.)	97
1. Background on the classical theorems	97
2. Formulation of the problem and counterexamples	98
3. An oversimplified description of the results	101
4. The statements of the theorems	103
5. Sketch proofs of the theorems	106
Chapter XII. The equivariant stable homotopy category	111
1. An introductory overview	111
2. Prespectra and spectra	113
3. Smash products	115
4. Function spectra	117
5. The equivariant case	119
6. Spheres and homotopy groups	119
7. G -CW spectra	122
8. Stability of the stable category	125
9. Getting into the stable category	126
Chapter XIII. $RO(G)$-graded homology and cohomology theories	129
1. Axioms for $RO(G)$ -graded cohomology theories	129
2. Representing $RO(G)$ -graded theories by G -spectra	131
3. Brown's theorem and $RO(G)$ -graded cohomology	134
4. Equivariant Eilenberg-Mac Lane spectra	136
5. Ring G -spectra and products	139
Chapter XIV. An introduction to equivariant K-theory (by J. P. C. Greenlees)	143
1. The definition and basic properties of K_G -theory	143
2. Bundles over a point: the representation ring	144
3. Equivariant Bott periodicity	146
4. Equivariant K -theory spectra	147
5. The Atiyah-Segal completion theorem	149

6. The generalization to families	151
Chapter XV. An introduction to equivariant cobordism (by S. R. Costenoble)	153
1. A review of nonequivariant cobordism	153
2. Equivariant cobordism and Thom spectra	155
3. Computations: the use of families	158
4. Special cases: odd order groups and $\mathbb{Z}/2$	161
Chapter XVI. Spectra and G-spectra; change of groups; duality	163
1. Fixed point spectra and orbit spectra	163
2. Split G -spectra and free G -spectra	165
3. Geometric fixed point spectra	166
4. Change of groups and the Wirthmüller isomorphism	167
5. Quotient groups and the Adams isomorphism	169
6. The construction of G/N -spectra from G -spectra	171
7. Spanier-Whitehead duality	173
8. V -duality of G -spaces and Atiyah duality	175
9. Poincaré duality	176
Chapter XVII. The Burnside ring	179
1. Generalized Euler characteristics and transfer maps	179
2. The Burnside ring $A(G)$ and the zero stem $\pi_0^G(S)$	182
3. Prime ideals of the Burnside ring	183
4. Idempotent elements of the Burnside ring	185
5. Localizations of the Burnside ring	186
6. Localization of equivariant homology and cohomology	188
Chapter XVIII. Transfer maps in equivariant bundle theory	191
1. The transfer and a dimension-shifting variant	191
2. Basic properties of transfer maps	193
3. Smash products and Euler characteristics	195
4. The double coset formula and its applications	197
5. Transitivity of the transfer	201
Chapter XIX. Stable homotopy and Mackey functors	203
1. The splitting of equivariant stable homotopy groups	203
2. Generalizations of the splitting theorems	206
3. Equivalent definitions of Mackey functors	207
4. Induction theorems	209
5. Splittings of rational G -spectra for finite groups G	212
Chapter XX. The Segal conjecture	215
1. The statement in terms of completions of G -spectra	215
2. A calculational reformulation	217
3. A generalization and the reduction to finite p -groups	219
4. The proof of the Segal conjecture for finite p -groups	221
5. Approximations of singular subspaces of G -spaces	223
6. An inverse limit of Adams spectral sequences	225
7. Further generalizations; maps between classifying spaces	227
Chapter XXI. Generalized Tate cohomology (by J. P. C. Greenlees and J. P. May)	231
1. Definitions and basic properties	231
2. Ordinary theories; Atiyah-Hirzebruch spectral sequences	234
3. Cohomotopy, periodicity, and root invariants	236

complement $W - V$, the inclusion induces a natural transformation $\sigma^{W-V} : \Sigma^V \longrightarrow \Sigma^W$.

2. Stably almost complex structures and bordism

When G is the trivial group, a *stably almost complex structure* on a compact smooth manifold M is an element $[\xi] \in \tilde{K}(M)$, which goes to the class $[\nu M]$ of the stable normal bundle under the map

$$\tilde{K}(M) \longrightarrow \widetilde{KO}(M).$$

It is, of course, essentially equivalent to define this with $[\tau M]$ replacing $[\nu M]$, since these classes are additive inverses in $\widetilde{KO}(M)$.

The following definition gives the obvious equivariant generalization of this.

DEFINITION 2.1. If $[\xi] \in \tilde{K}_G(M)$ is a lift of $[\nu M] \in \widetilde{KO}_G(M)$ under the natural map, we call the pair $(M, [\xi])$ a *normally almost complex G -manifold*.

We will use the notation $M_{[\xi]}$ when necessary, but we will drop $[\xi]$ whenever there is no risk of confusion.

The bordism theory of these objects, denoted mu_*^G , is the “complex analog” of the unoriented theory mo_*^G discussed in Chapter XV. If V is a *complex* G -module and $(M, \partial M)_{[\xi]}$ is a G -manifold with a stably almost complex structure, then its V -suspension becomes a G -manifold after “straightening the angles”, and $[\xi] - [\varepsilon_V]$ is a complex structure on $\Sigma^V(M, \partial M)$. This gives rise to a *suspension homomorphism*

$$\sigma^V : mu_*^G(X, A) \longrightarrow mu_{*+|V|}^G(\Sigma^V(X, A)),$$

which sends the class of a map $(M, \partial M) \longrightarrow (X, A)$ to the class of its suspension. Due to the failure of G -transversality, both the suspension homomorphisms and the Pontrjagin-Thom map are generally not bijective.

We construct a stabilized version of this theory as follows. Let \mathcal{U} be an infinite-dimensional complex G -module equipped with a hermitian inner product whose underlying \mathbb{R} -linear structure is that of a complete G -universe. Define

$$MU_*^G(X, A) = \operatorname{colim}_V mu_*^G(\Sigma^V(X, A)),$$

where V ranges over all finite-dimensional complex G -subspaces of \mathcal{U} and the colimit is taken over all suspension maps induced by inclusions. We should perhaps point out that MU_*^G is not a connective theory unless G is trivial. The advantage of this new theory over mu_*^G is that the bad behavior of the Pontrjagin-Thom map is corrected, and the maps induced by suspension by complex G -modules are isomorphisms by construction. This should be interpreted as a form of periodicity. Homology or cohomology theories with this property are often referred to in the literature as *complex-stable*. Other examples of such theories include equivariant complex K -theory, its associated Borel construction, etc. Complex-stability isomorphisms should not be confused with suspension isomorphisms of the form

$$\Sigma^V : h_*^G(X, A) \longrightarrow h_{*+|V|}^G(\Sigma^V(X, A)),$$

which are part of the structure of all $RO(G)$ -graded homology theories.

MU_*^G or, more precisely, its dual cohomology theory was first constructed by tom Dieck in terms of a G -prespectrum TU_G , bearing the same relationship to complex Grassmanians as the G -prespectrum TO_G discussed in XV§2, does to real ones. An argument of Bröcker and Hook for unoriented bordism readily adapts to the complex case to show the equivalence of the two approaches. In what follows, we shall focus on the spectrification MU_G of TU_G . As with any representable equivariant homology theory, MU_*^G can be extended to an $RO(G)$ -graded homology theory, but we shall concern ourselves only with integer gradings. We point out, however, that complex-stable theories are always $RO(G)$ -gradable.

A key feature of MU_G , proven in XXVI§7, is the fact that it is a split G -spectrum; this may be seen geometrically as a consequence of the fact that the augmentation map $MU_*^G \rightarrow MU_*$, given on representatives by neglect of structure, can be split by regarding non-equivariant stably almost complex manifolds as G -manifolds with trivial action. The splitting makes $MU_*^G = MU_*^G(S^0)$ a module over the ring MU_* .

The multiplicative structure of the ring G -spectrum MU_G can be interpreted geometrically as coming from the fact that the class of normally stably almost complex manifolds is closed under finite products. The complex-stability isomorphisms are well-behaved with respect to the multiplicative structure: in cohomology, we have a commutative diagram

$$\begin{array}{ccc} MU_G^*(X) \otimes MU_G^*(Y) & \longrightarrow & MU_G^*(X \wedge Y) \\ \sigma^V \otimes \sigma^W \downarrow & & \downarrow \sigma^{V \oplus W} \\ MU_G^{*+|V|}(\Sigma^V X) \otimes MU_G^{*+|W|}(\Sigma^W Y) & \longrightarrow & MU_G^{*+|V|+|W|}(\Sigma^{V \oplus W} X \wedge Y) \end{array}$$

for all based G -spaces X and Y and complex G -modules V and W . In general, for a multiplicative cohomology theory, commutativity of a diagram of the form above is assumed as part of the definition of complex-stability. K_G^* is another example of a multiplicative complex-stable cohomology theory, as is the Borel construction on any such theory.

The role of MU_G in the equivariant world is analogous to that of MU in classical homotopy theory, for its associated cohomology theory has a privileged position among those which are multiplicative, complex-stable, and have natural Thom classes (for complex G -vector bundles). We record the axiomatic definition of such theories.

DEFINITION 2.2. A G -equivariant multiplicative cohomology theory h_G^* is said to have natural Thom classes for complex G -vector bundles if for every such bundle ξ of complex dimension n over a pointed G -space X there exists a class $\tau_\xi \in h_G^{2n}(T(\xi))$, with the following three properties:

- (1) *Naturality:* If $f: Y \rightarrow X$ is a pointed G -map, then $\tau_{f^*\xi} = f^*(\tau_\xi)$.
- (2) *Multiplicativity:* If ξ and η are complex G -vector bundles over X , then

$$\tau_{\xi \oplus \eta} = \tau_\xi \times \tau_\eta \in h_G^{|\xi|+|\eta|}(T(\xi \oplus \eta)).$$

(3) *Normalization*: If V is a complex G -module, then $\tau_V = \sigma^V(1)$.

The following result, which admits a quite formal proof (given for example by Okonek) explains the universal role played by MU_G .

PROPOSITION 2.3. *If h_G^* is a multiplicative, complex-stable, cohomology theory with natural Thom classes for complex G -bundles, then there is a unique natural transformation $MU_G^*(-) \rightarrow h_G^*(-)$ of multiplicative cohomology theories that takes Thom classes to Thom classes.*

Returning to homology, for a complex G -bundle ξ of complex dimension k , the Thom class of ξ gives rise to a Thom isomorphism

$$\tau : MU_*^G(T(\xi)) \rightarrow MU_{*-2k}^G(B(\xi)_+),$$

and similarly in cohomology. This isomorphism is constructed in the same way as in the nonequivariant case (see e.g. [LMS]), without using any feature of MU_*^G other than the existence and formal properties of Thom classes. However, in this special case, its *inverse* has a rather pleasant geometric interpretation: if $f : M \rightarrow B(\xi)$ represents an element in $mu_n^G(B(\xi)_+)$, the map \bar{f} in the pullback diagram

$$\begin{array}{ccc} E(f^*\xi) & \xrightarrow{\bar{f}} & E(\xi) \\ f^*\xi \downarrow & & \downarrow \xi \\ M & \xrightarrow{f} & B(\xi) \end{array}$$

represents an element in $mu_{n+2k}^G(T(\xi))$. This procedure allows the construction of a homomorphism which stabilizes to the inverse of the Thom isomorphism. See Bröcker and Hook for the details of a treatment of the Thom isomorphism (in the unoriented case) that uses this interpretation.

3. Tangential structures

Unfortunately, both mu_*^G and MU_*^G are rather intractable from the computational point of view. In order to address this difficulty, we shall introduce a new bordism theory, much more amenable to calculation, whose stabilization is also MU_G^* .

Consider the following variant of reduced K -theory: if X is a G -space, instead of taking the quotient by the subgroup generated by all trivial complex G -bundles, take the quotient by the subgroup generated by those trivial bundles of the form $\mathbb{C}^n \times X$, where G acts trivially on \mathbb{C}^n . We denote the group so obtained as \tilde{K}_G ; there is an analogous construction in the real case, which we denote $\tilde{K}O_G$.

DEFINITION 3.1. A tangentially stably almost complex manifold is a smooth manifold equipped with a lift of the class $[\tau M] \in \check{K}O_G(M)$ to $\check{K}_G(M)$.

We shall refer to the bordism theory of these manifolds as *tangential complex bordism*, denoted $\Omega_*^{U,G}$.

We warn the reader that nowhere in the literature is the distinction between the complex bordism theories $\Omega_*^{U,G}$ and mu_*^G made clear. This is not mere pedantry on our part, as our next result will show. It was pointed out to the author by Costenoble that this result does not hold for normally stably almost complex G -manifolds.

PROPOSITION 3.2. *If M is a tangentially stably almost complex G -manifold and $H \subseteq G$ is a closed normal subgroup, then the G -tubular neighborhood around M^H has a complex structure.*

We stress the fact that no stabilization is necessary to get a complex structure on the tubular neighborhood; this lies at the heart of the calculations we shall carry out later in the chapter.

PROOF. The first thing to observe is that $\tau(M^H) = (\tau M|_{M^H})^H$ as real vector bundles. If ξ is the restriction to M^H of a complex G -vector bundle over M that represents its tangential stably almost complex structure, and the underlying real G -vector bundle of ξ is $\tau M|_{M^H} \oplus \varepsilon_{\mathbb{R}^n}$, then $(\xi^H)^\perp$ is a complex G -vector bundle. We have

$$\xi = \xi^H \oplus (\xi^H)^\perp = (\tau M|_{M^H})^H \oplus \varepsilon_{\mathbb{R}^n} \oplus \nu(M^H, M).$$

This gives the desired structure. \square

We next explore the relation between mu_*^G and $\Omega_*^{U,G}$. There is a commutative square

$$\begin{array}{ccc} \check{K}_G(X) & \longrightarrow & \check{K}O_G(X) \\ \downarrow & & \downarrow \\ \tilde{K}_G(X) & \longrightarrow & \widetilde{K}O_G(X) \end{array}$$

that yields a natural transformation of homology theories $\phi : mu_*^G \longrightarrow \Omega_*^{U,G}$. Just as we did with mu_*^G , we may stabilize $\Omega_*^{U,G}$ with respect to suspensions by finite-dimensional complex subrepresentations of a complete G -universe, obtaining a new complex-stable homology theory which we shall provisionally denote $\check{M}U_*^G$. The map ϕ stabilizes to a natural transformation $\Phi : \check{M}U_*^G \longrightarrow MU_*^G$. The following result was first proved by the author and Costenoble by a different argument and is central to the results of this chapter.

THEOREM 3.3. *Φ is an isomorphism of homology theories.*

We shall need the following standard result.

LEMMA 3.4. (Change of groups isomorphism) *If $H \subseteq G$ is a closed subgroup of codimension j , then for all H -spaces X there is an isomorphism*

$$mu_*^H(X_+) \xrightarrow{\cong} mu_{*+j}^G((G \times_H X)_+)$$

induced by application of the functor $G \times_H (-)$ to representatives of bordism classes of maps, and similarly for pairs. The analogous result holds for $\Omega_^{U,G}$ and MU_*^G .*

SKETCH PROOF. If we apply the functor $G \times_H (-)$ to a map $f: M \rightarrow X$ that represents an element of $mu_n^H(X_+)$, we obtain an element of $mu_{n+j}^G((G \times_H X)_+)$. Conversely, if $g: N \rightarrow G \times_H X$ represents an element of $mu_{n+j}^G((G \times_H X)_+)$ and if $\pi: G \times_H X \rightarrow X$ is the evident H -map, we set $M = (\pi g)^{-1}(eH)$ and see that M is an H -manifold such that $N = G \times_H M$ and the restriction of g to M represents an element of $mu_n^H(X_+)$. \square

PROOF OF THEOREM 3.3. We show first that the theorem is true for $G = SU(2k+1)$ and then extend the result to the general case by a change of groups argument.

We recall a few standard facts about representations of special unitary groups (e.g., from Bröcker and tom Dieck). Let M be the complex $SU(2k+1)$ -module such that $M = \mathbb{C}^{2k+1}$ with the action of $SU(2k+1)$ given by matrix multiplication and let $\Lambda^i = \Lambda^i M$. Then $R(SU(2k+1))$ is the polynomial algebra over \mathbb{Z} on the representations Λ^i , $1 \leq i \leq 2k$, all of which are irreducible and of complex type. Furthermore, $\Lambda^{2k-i+1} = \overline{\Lambda^i}$. This implies that any irreducible real representation of $SU(2k+1)$ is either trivial or admits a complex structure. To see this, let W be a non-trivial irreducible real $SU(2k+1)$ -module. Suppose first that $W \otimes_{\mathbb{R}} \mathbb{C}$ is irreducible. Since the restriction to \mathbb{R} of an irreducible complex representation of quaternionic type is irreducible, our assumptions imply that $W \otimes_{\mathbb{R}} \mathbb{C}$ is of real type and of the form $V \otimes_{\mathbb{C}} \overline{V}$, where V is a monomial in the Λ^i , $1 \leq i \leq k$. We have

$$(\overline{V} \otimes_{\mathbb{C}} V) \otimes_{\mathbb{R}} \mathbb{C} \cong (2W) \otimes_{\mathbb{R}} \mathbb{C} \cong 2(V \otimes_{\mathbb{C}} \overline{V})$$

as complex representations. On the other hand, since $2W \cong V \otimes_{\mathbb{C}} \overline{V}$, we have isomorphisms of complex $SU(2k+1)$ -modules

$$(2W) \otimes_{\mathbb{R}} \mathbb{C} \cong (V \otimes_{\mathbb{C}} \overline{V}) \otimes_{\mathbb{R}} \mathbb{C} \cong V \otimes_{\mathbb{C}} (\overline{V} \otimes_{\mathbb{R}} \mathbb{C})$$

and

$$V \otimes_{\mathbb{C}} (\overline{V} \otimes_{\mathbb{R}} \mathbb{C}) \cong (V \otimes_{\mathbb{C}} V) \oplus (V \otimes_{\mathbb{C}} \overline{V})$$

(because $\overline{V} \otimes_{\mathbb{R}} \mathbb{C} \cong V \oplus \overline{V}$). So it follows that

$$2(V \otimes_{\mathbb{C}} \overline{V}) \cong (V \otimes_{\mathbb{C}} V) \oplus (V \otimes_{\mathbb{C}} \overline{V}),$$

which is absurd in view of the structure of $RSU(2k+1)$. Thus W must be reducible and so it is either of the form $V_1 \oplus V_1$, for an irreducible complex V_1 of quaternionic type, or $V_1 \oplus \overline{V}_1$, for an irreducible complex V_1 of complex type.

The first possibility is ruled out by the fact that all self-conjugate irreducible complex representations of $SU(2k+1)$ are of real type. So we must have

$$2W \cong V_1 \oplus \overline{V}_1 \cong 2V$$

as real representations, and therefore, using the uniqueness of isotypical decompositions, we may conclude that $W \cong V$ as real representations.

Now let X be a $SU(2k+1)$ -space and consider a map representing an element in $MU_*^G(X)$. By complex-stability, there is no loss of generality in assuming that our map is of the form $f : M \rightarrow X$, where $\tau M \oplus \epsilon_V \cong \xi$, V is a real representation, and ξ is a complex $SU(2k+1)$ -vector bundle. By the remark above, $V = W \oplus \mathbb{R}^k$ for a complex representation W . Then $\Sigma^W(M, \partial M)$ is a tangentially stably almost complex manifold and the class of $\Sigma^W f$ is in the image of ϕ . It follows that Φ is surjective. A similar argument applied to bordisms shows that Φ is injective.

To obtain the general case, observe that any compact Lie group embeds in $U(2k)$, and $U(2k)$ embeds in $SU(2k+1)$ (via the map that sends $A \in U(2k)$ to $(\det A)^{-1} \cdot 1_{\mathbb{R}} \oplus A$), and apply Lemma 3.4. \square

4. Calculational tools

For the remainder of the chapter, all Lie groups we consider will be Abelian.

There is a long list of names associated to the calculation of $\Omega_*^{U,G}(S^0)$ for different classes of compact Lie groups: Landweber (cyclic groups), Stong (Abelian p -groups), Ossa (finite Abelian groups), Löffler (Abelian groups), Lazarov (groups of order pq for distinct primes p and q), and Rowlett (extensions of a cyclic group by a cyclic group of relatively prime order). All of these authors rely on the study of fixed point sets by various subgroups, together with their normal bundles, through the use of bordism theories with suitable restrictions on isotropy subgroups.

The main calculational tool is the use of families of subgroups, which works in exactly the same fashion as was discussed in the real case in XV§3. Recall that, for a family \mathcal{F} , an \mathcal{F} -space is a G -space all of whose isotropy subgroups are in \mathcal{F} and that we write $E\mathcal{F}$ for the universal \mathcal{F} -space. Recall too that, for a G -homology theory h_*^G and a pair of families $(\mathcal{F}, \mathcal{F}')$, $\mathcal{F}' \subseteq \mathcal{F}$, there is an associated homology theory $h_*^G[\mathcal{F}, \mathcal{F}']$, defined on pairs of G -spaces as

$$h_*^G[\mathcal{F}, \mathcal{F}'](X, A) = h_*^G(X \times E\mathcal{F}, (X \times \mathcal{F}') \cup (A \times E\mathcal{F})).$$

When $\mathcal{F}' = \emptyset$, we use the notation $h_*^G[\mathcal{F}]$. The theories $h_*^G[\mathcal{F}]$, $h_*^G[\mathcal{F}']$, and $h_*^G[\mathcal{F}, \mathcal{F}']$ fit into a long exact sequence. Of course, there is an analogous construction in cohomology.

In the special case of $\Omega_*^{U,G}$ (and similarly for other bordism theories), it is easy to see that $\Omega_*^{U,G}[\mathcal{F}, \mathcal{F}']$ has an alternative interpretation: it is the bordism theory of $(\mathcal{F}, \mathcal{F}')$ -tangentially almost-complex manifolds, that is, com-

pact, tangentially almost complex \mathcal{F} -manifolds with boundary, whose boundary is an \mathcal{F}' -manifold.

DEFINITION 4.1. A pair of families $(\mathcal{F}, \mathcal{F}')$ of subgroups of G is called a neighboring pair differing by H if there is a subgroup H such that if $K \in \mathcal{F} - \mathcal{F}'$, then H is a subconjugate of K .

This notion was first used by Löffler, but the terminology is not standard. A special case is the more usual notion of an *adjacent* pair of families pair differing by H , which is a neighboring pair $(\mathcal{F}, \mathcal{F}')$ such that $\mathcal{F} - \mathcal{F}'$ consists of those subgroups conjugate to H .

The next proposition explains the importance of neighboring families. We introduce some terminology and notation to facilitate its discussion.

Given a subgroup H of an Abelian Lie group G , we choose a set $\mathcal{C}_{G,H}$ of finite dimensional complex G -modules whose restrictions to H form a non-redundant, complete set of irreducible, nontrivial complex H -modules. If \mathbb{C} denotes the trivial irreducible representation, we let $\mathcal{C}_{G,H}^+ = \mathcal{C}_{G,H} \cup \{\mathbb{C}\}$. For a nonnegative even integer k , we shall call an array of nonnegative integers $P = (p_V)_{V \in \mathcal{C}_{G,H}}$ a (G, H) -partition of k if

$$k = \sum_{V \in \mathcal{C}_{G,H}} 2p_V.$$

For such a partition P , we let

$$BU(P, G) = \prod_{V \in \mathcal{C}_{G,H}} BU(p_V, G).$$

We let $\mathcal{P}(k, G, H)$ denote the set of all (G, H) -partitions of k .

PROPOSITION 4.2. If $(\mathcal{F}, \mathcal{F}')$ is a neighboring pair of families of subgroups of a compact Abelian Lie group G differing by a subgroup H , then

$$\Omega_n^{U,G}[\mathcal{F}, \mathcal{F}'](X, A) \cong \bigoplus_{\substack{0 \leq 2k \leq n \\ P \in \mathcal{P}(2k, G, H)}} \Omega_{n-2k}^{U, G/H}[\mathcal{F}/H]((X^H, A^H) \times BU(P, G/H)),$$

where \mathcal{F}/H denotes the family of subgroups of G/H that is obtained by taking the quotient of each element of $\mathcal{F} - \mathcal{F}'$ by H .

SKETCH OF PROOF. For simplicity, we concentrate on the absolute case. Let $f : M \rightarrow X$ represent an element in $\Omega_n^{U,G}[\mathcal{F}, \mathcal{F}'](X_+)$ and let T be a (closed) G -tubular neighborhood of M^H . We may view T as the total space of the unit disc bundle of the normal bundle to M^H . We may also view T as an n -dimensional \mathcal{F} -manifold whose boundary is an \mathcal{F}' -manifold. Thus T represents an element of $\Omega_n^{U,G}[\mathcal{F}, \mathcal{F}'](S^0)$, and we see that $[f] = [f|_T]$ in $\Omega_n^{U,G}[\mathcal{F}, \mathcal{F}'](X_+)$. Furthermore, $[f] = 0$ if and only if there is an H -trivial G -nullbordism of $f|_T$, equipped with a complex G -vector bundle whose unit disc bundle restricts to T on M^H . Observe that M^H breaks up into various components of constant even codimension. In other words, $\Omega_n^{U,G}[\mathcal{F}, \mathcal{F}'](X_+)$ can be identified with the direct sum, with $2k$ ranging between 0 and n , of bordism of H -trivial \mathcal{F} -manifolds of dimension $n - 2k$ equipped with a complex G -vector bundle of dimension k ,

containing no H -trivial summands. Note the twofold importance of Proposition 3.2: not only are we using that M^H is tangentially almost complex, but also that its tubular neighborhood carries a complex structure.

Consider the bundle-theoretic analog of the isotypical decomposition of a linear representation. For complex G -vector bundles E and F over a space X we may construct the vector bundle $\text{Hom}_{\mathbb{C}}(E, F)$ whose fiber over $x \in X$ is $\text{Hom}_{\mathbb{C}}(E_x, F_x)$; G acts on $\text{Hom}_{\mathbb{C}}(E, F)$ by conjugation. If X is H -trivial, then $\text{Hom}_H(E, F) = (\text{Hom}_{\mathbb{C}}(E, F))^H$ is an H -trivial G -subbundle; if one regards X as a (G/H) -space, then $\text{Hom}_H(E, F)$ becomes a (G/H) -vector bundle over X .

We apply this to $F = T$ and $E = \varepsilon_V$, where V is a complex G -module whose restriction to H is irreducible, thus obtaining a (G/H) -vector bundle which we call the V -multiplicity of E . The evaluation map

$$\bigoplus_{V \in \mathcal{C}_{G,H}^+} \text{Hom}_H(\varepsilon_V, T) \otimes_{\mathbb{C}} \varepsilon_V \longrightarrow T$$

is a G -vector bundle isomorphism, and this decomposition into isotypical summands is unique. Note that in the special case we are considering, the multiplicity associated to the trivial representation is 0, so the sum really does run over $\mathcal{C}_{G,H}$.

Therefore T can be identified with a direct sum of (G/H) -vector bundles over M^H , each corresponding to an irreducible complex representation of H , and M^H breaks into a disjoint union of components on which the dimension of each multiplicity remains constant; each of these components therefore has an associated (G, H) -partition, accounting for the summation over $\mathcal{P}(2k, G, H)$ in our formula. Clearly the bundle on the component associated to a (G, H) -partition P is classified by $BU(P, G/H)$. \square

Similar methods allow us to prove the following standard result.

PROPOSITION 4.3. *With the notation above, if H is a subgroup of an Abelian Lie group G , then*

$$BU(n, G)^H \cong \coprod_{P \in \mathcal{P}(n, G, H)} \prod_{V \in \mathcal{C}_{G,H}^+} BU(p_V, G/H)$$

as H -trivial G -spaces.

PROOF. It suffices to observe that the right hand side classifies n -dimensional complex G -vector bundles over H -trivial G -spaces. \square

5. Statements of the main results

We come now to a series of theorems, some old, some new, that are consequences of the previous results. In all of them, we consider a given compact Abelian Lie group G .

THEOREM 5.1 (LÖFFLER). *If V is a complex G -module, and X is a disjoint union of pairs of G -spaces of the form*

$$(DV, SV) \times \prod_{i=1}^k BU(n_i, G),$$

then $\Omega_^{U,G}(X)$ is a free MU_* -module concentrated in even degrees.*

THEOREM 5.2. *With the same hypotheses on X , the map*

$$\Omega_*^{U,G}(BU(n, G) \times X) \longrightarrow \Omega_*^{U,G}(BU(n+1, G) \times X)$$

induced by Whitney sum with the trivial bundle ε_G is a split monomorphism of MU_ -modules.*

THEOREM 5.3. *MU_*^G is a free MU_* -module concentrated in even degrees.*

THEOREM 5.4. *The stabilization map $\Omega_*^{U,G} \longrightarrow MU_*^G$ is a split monomorphism of MU_* -modules.*

Theorem 5.3 is stated in the second paper of Löffler cited below, but there seems to be no proof in the literature. Ours is a refinement of the ideas in the proof of Theorem 5.1, which yields Theorem 5.4 as a by-product, and is entirely self-contained (that is, it does not depend on results on finite Abelian groups). Tom Dieck has used a completely different method to prove a weaker version of Theorem 5.4, for G cyclic of prime order, but to the best of our knowledge nothing of the sort has previously been claimed or proved at our level of generality. Theorem 5.2, which also seems to be new, is required in the course of the proof of Theorem 5.3 and is of independent interest.

In the light of these results, it is natural to conjecture, probably overoptimistically, that MU_*^G is free over MU_* and concentrated in even degrees for any compact Lie group G . We have succeeded in verifying this for a class of non-Abelian groups that includes $O(2)$ and the dihedral groups. The statement about the injectivity of the stabilization map also holds for these groups. We hope to extend these results to other classes of non-Abelian groups; details will appear elsewhere.

The results above should be proven in the given order, but, since the proofs have a large overlap, we shall deal with all of them simultaneously.

We shall proceed by induction on the number of "cyclic factors" of the group, where, for the purposes of this discussion, S^1 counts as a cyclic group. The argument in each case is as follows: the result is either trivial or well-known for

the trivial group. Then, one shows that if the result is true for a compact Lie group G , it also holds for $G \times S^1$, and this in turn implies the same for $G \times \mathbb{Z}_n$.

6. Preliminary lemmas and families in $G \times S^1$

For brevity, the subgroups $\{1\} \times S^1 \subseteq G \times S^1$ and $\{1\} \times \mathbb{Z}_n \subseteq G \times \mathbb{Z}_n$ will be denoted S^1 and \mathbb{Z}_n , respectively.

We shall need to consider the following families of subgroups of $G \times S^1$:

$$\begin{aligned}\mathcal{F}_i &= \{H \subseteq G \times S^1 \mid |H \cap S^1| \leq i\} \\ \mathcal{F}_\infty &= \{H \subseteq G \times S^1 \mid H \cap S^1 \neq S^1\} \\ \mathcal{A} &= \{\text{all closed subgroups of } G \times S^1\}\end{aligned}$$

These give rise to the neighboring pairs $(\mathcal{F}_{i+1}, \mathcal{F}_i)$ (differing by \mathbb{Z}_{i+1}) and $(\mathcal{A}, \mathcal{F}_\infty)$ (differing by S^1). Observe that \mathcal{F}_∞ is the union of its subfamilies \mathcal{F}_i .

LEMMA 6.1. *Let G be a compact Lie group and X be a pair of $(G \times S^1)$ -spaces. Then*

$$\Omega_*^{U, G \times S^1}(X \times S^1) \cong \Omega_{*-1}^{U, G}(X)$$

and

$$\Omega_*^{U, G \times S^1}((X \times S^1)/\mathbb{Z}_n) \cong \Omega_{*-1}^{U, G \times \mathbb{Z}_n}(X),$$

where $G \times S^1$ acts on S^1 and S^1/\mathbb{Z}_n through the projection $G \times S^1 \rightarrow S^1$; the same statement holds for the theories $mu_*^{G \times S^1}$ and $MU_*^{G \times S^1}$.

The proofs of these isomorphisms are easy verifications and will be omitted; see Löffler. We shall also need the following result of Conner and Smith.

LEMMA 6.2. *A graded, projective, bounded below MU_* -module is free.*

LEMMA 6.3. *Consider a diagram of projective modules with exact rows*

$$\begin{array}{ccccccc} 0 & \longrightarrow & A & \longrightarrow & B & \longrightarrow & C \longrightarrow 0 \\ & & \downarrow f_1 & & \downarrow f_2 & & \downarrow f_3 \\ 0 & \longrightarrow & A' & \longrightarrow & B' & \longrightarrow & C' \longrightarrow 0. \end{array}$$

If f_1 and f_3 (resp. f_2 and f_3) are split monomorphisms, so is f_2 (resp. f_1).

PROOF. Add a third row consisting of the cokernels of the f_i , which will be exact by the Snake Lemma. An easy diagram chase shows that the modules in the new row are projective, and therefore the conclusion follows. \square

Note that we make no assumptions about compatibility of the splittings.

REMARK 6.4. If X is a pair of G -spaces of the kind appearing in the statement of Theorem 5.1 and H is a subgroup of G , then restricting the action to H yields an H -pair of the same kind. Moreover, by Proposition 4.3, X^H is a (G/H) -pair of the same type. This class of pairs of spaces is also closed under cartesian product with $BU(n, G)$ and with pairs of the form (DW, SW) for a complex G -module W .

7. On the families \mathcal{F}_i in $G \times S^1$

In what follows, for a G -pair X and a homology theory h_* , ψ will designate a map of the form

$$\psi : h_*(BU(n, G) \times X) \longrightarrow h_*(BU(n+1, G) \times X)$$

that is induced by taking the Whitney sum of the universal complex G -bundle over $BU(n, G)$ and the trivial G -bundle ε_G .

Suppose that Theorems 5.1 – 5.4 have been proved for G . We shall deduce the following result in the case $G \times S^1$.

THEOREM 7.1. *The following statements hold for each $i \geq 1$ and for $i = \infty$.*

- (1) $\Omega_*^{U, G \times S^1}[\mathcal{F}_i](X)$ is a free MU_* -module concentrated in odd degrees.
- (2) *The map*

$$\psi : \Omega_*^{U, G \times S^1}[\mathcal{F}_i](BU(n, G \times S^1) \times X) \longrightarrow \Omega_*^{U, G \times S^1}[\mathcal{F}_i](BU(n+1, G \times S^1) \times X)$$

is a split monomorphism of MU_ -modules.*

- (3) *If W is an irreducible complex $(G \times S^1)$ -module, then the map*

$$\sigma^W : \Omega_*^{U, G \times S^1}[\mathcal{F}_i](X) \longrightarrow \Omega_{*+2}^{U, G \times S^1}[\mathcal{F}_i]((DW, SW) \times X)$$

is a split monomorphism of MU_ -modules.*

- (4) *The map $\Omega_*^{U, G \times S^1}[\mathcal{F}_i](X) \longrightarrow \Omega_*^{U, G \times S^1}(X)$ is zero.*

PROOF. We first prove this for $i = 1$, making use of a suitable model for the space $E\mathcal{F}_1$. Let $(W_i)_{i \geq 1}$ be a sequence of irreducible complex $(G \times S^1)$ -modules such that S^1 acts freely on their unit circles, and every isomorphism class of such $(G \times S^1)$ -modules appears infinitely many times. Let $V_k = \bigoplus_{i=1}^k W_i$ and

$$SV_\infty = \text{colim}_k SV_k;$$

SV_∞ is the required space. Note also that this space embeds into the equivariantly contractible space

$$DV_\infty = \text{colim}_k DV_k.$$

Using Lemma 6.1 and our assumptions about G , we see that $\Omega_*^{U, G \times S^1}(SV_1 \times X)$ is a free MU_* -module concentrated in odd degrees, and that

$$\sigma^W : \Omega_*^{U, G \times S^1}(SV_1 \times X) \longrightarrow \Omega_*^{U, G \times S^1}((DW, SW) \times SV_1 \times X)$$

and

$$\Omega_*^{U, G \times S^1}(SV_1 \times BU(n, G \times S^1) \times X) \longrightarrow \Omega_*^{U, G \times S^1}(SV_1 \times BU(n+1, G \times S^1) \times X)$$

are split monomorphisms of MU_* -modules.

We calculate $\Omega_*^{U, G \times S^1}((SV_{k+1}, SV_k) \times X)$ using the homotopy equivalence

$$(SV_{k+1}, SV_k) \simeq (SW_{k+1} * SV_k, DW_{k+1} \times SV_k),$$

and the excisive inclusion

$$SW_{k+1} \times (DV_k, SV_k) \longrightarrow (SW_{k+1} * SV_k, DW_{k+1} \times SV_k).$$

The action of $G \times S^1$ on SW_{k+1} determines and is determined by a split group epimorphism $G \times S^1 \longrightarrow S^1$ with kernel $H \subseteq G \times S^1$, $H \cong G$. This implies that SW_{k+1} is $(G \times S^1)$ -homeomorphic to $(G \times S^1)/H$. By a change of groups argument and the inductive hypothesis, we see that $\Omega_*^{G, U}((SV_{k+1}, SV_k) \times X)$ is free and concentrated in odd degrees and that the maps induced respectively by suspension by an irreducible complex G -module and by addition of the bundle $\varepsilon_{\mathbb{C}}$ are split monomorphisms of MU_* -modules.

The diagram with exact columns (in which j is odd)

$$\begin{array}{ccc} 0 & & 0 \\ \downarrow & & \downarrow \\ \Omega_j^{U, G \times S^1}(SV_k \times X) & \xrightarrow{\sigma^W} & \Omega_{j+2}^{U, G \times S^1}((DW, SW) \times SV_k \times X) \\ \downarrow & & \downarrow \\ \Omega_j^{U, G \times S^1}(SV_{k+1} \times X) & \xrightarrow{\sigma^W} & \Omega_{j+2}^{U, G \times S^1}((DW, SW) \times SV_{k+1} \times X) \\ \downarrow & & \downarrow \\ \Omega_j^{U, G \times S^1}((SV_{k+1}, SV_k) \times X) & \xrightarrow{\sigma^W} & \Omega_{j+2}^{U, G \times S^1}((DW, SW) \times (SV_{k+1}, SV_k) \times X) \\ \downarrow & & \downarrow \\ 0 & & 0 \end{array}$$

and the results above show by induction that, for all $k \geq 1$, $\Omega_*^{U, G \times S^1}(SV_k \times X)$ is free and concentrated in odd degrees and that σ^W is a split monomorphism. An analogous diagram shows the same is true for the map ψ induced by adding $\varepsilon_{\mathbb{C}}$.

To complete the proofs of (1) – (3) when $i = 1$, it suffices to observe that each step in the colimit contributes a direct summand to SV_{∞} . To prove (4), let $f : M \longrightarrow X \times SV_{\infty}$ represent an element of $\Omega_*^{U, G \times S^1}[\mathcal{F}_1](X)$. Since S^1 acts freely on M and all actions on a circle are linear, $p : M \longrightarrow M/S^1$ is the unit circle bundle of a 1-dimensional complex G -bundle E (the complex structure is given by multiplication by $i \in S^1$). Obviously, the circle bundle bounds a disc bundle, whose total space is a complex $(G \times S^1)$ -manifold W . Any point $x \in W$ can be written as ty , where $t \in [0, 1]$ and $y \in M$, so f extends to an equivariant

map $F : W \longrightarrow X \times DV_\infty$ defined as $F(ty) = tf(y)$, where the multiplication on the right hand side is given by the linear structure of DV_∞ .

We prove the case $i \geq 1$ of Theorem 7.1 by induction on i . Observe first that the case $i = \infty$ will follow directly from the case of finite i since

$$E\mathcal{F}_\infty = \operatorname{colim}_i E\mathcal{F}_i.$$

Indeed, we shall see that each stage in the construction of $E\mathcal{F}_\infty$ as a colimit contributes a free direct summand to $\Omega_*^{U, G \times S^1}[\mathcal{F}_\infty](X)$ on which σ^W and ψ are split monomorphisms of MU_* -modules and the map to $\Omega_*^{U, G \times S^1}(X)$ is zero.

Applying Proposition 4.2 with (G, H) replaced by $(G \times S^1, \mathbb{Z}_{i+1})$ and noting that $(G \times S^1)/\mathbb{Z}_{i+1} \cong G \times S^1$ and that, under this isomorphism, the family $\mathcal{F}_{i+1}/\mathbb{Z}_{i+1}$ corresponds to the family \mathcal{F}_1 , we find that

$$\Omega_n^{U, G \times S^1}[\mathcal{F}_{i+1}, \mathcal{F}_i](X) \cong \bigoplus_{\substack{0 \leq 2k \leq n \\ P \in \mathcal{P}(2k, G \times S^1, \mathbb{Z}_{n+1})}} \Omega_{n-2k}^{U, G \times S^1}[\mathcal{F}_1](X^{\mathbb{Z}_{n+1}} \times BU(P, G \times S^1)).$$

Thus the case $i = 1$, combined with Remark 6.4, shows that the left-hand side is free and concentrated in *odd* degrees.

One then concludes, by using the long exact sequences of the pairs $[\mathcal{F}_{i+1}, \mathcal{F}_i]$, that for all i , $\Omega_*^{U, G \times S^1}[\mathcal{F}_i](X)$ is concentrated in *odd* degrees.

The diagrams with exact columns (in which j is odd)

$$\begin{array}{ccc} 0 & & 0 \\ \downarrow & & \downarrow \\ \Omega_j^{U, G}[\mathcal{F}_i](BU(n, G \times S^1) \times X) & \longrightarrow & \Omega_j^{U, G}[\mathcal{F}_i](BU(n+1, G \times S^1) \times X) \\ \downarrow & & \downarrow \\ \Omega_j^{U, G}[\mathcal{F}_{i+1}](BU(n, G \times S^1) \times X) & \longrightarrow & \Omega_j^{U, G}[\mathcal{F}_{i+1}](BU(n+1, G \times S^1) \times X) \\ \downarrow & & \downarrow \\ \Omega_j^{U, G}[\mathcal{F}_{i+1}, \mathcal{F}_i](BU(n, G \times S^1) \times X) & \twoheadrightarrow & \Omega_j^{U, G}[\mathcal{F}_{i+1}, \mathcal{F}_i](BU(n+1, G \times S^1) \times X) \\ \downarrow & & \downarrow \\ 0 & & 0 \end{array}$$

show that, for all i , $\Omega_*^{U, G}[\mathcal{F}_i](X)$ is a free MU_* -module and the map induced by addition of ε_C is a split monomorphism of MU_* -modules.

The study of the suspension map σ^W must be broken into two cases. Since W is an irreducible representation of $G \times S^1$, its fixed point space W^{S^1} is either W or $\{0\}$ and therefore either

- (1) $W^{\mathbb{Z}_{i+1}} = W$ or
- (2) $W^{\mathbb{Z}_{i+1}} = \{0\}$.

In the first case, the map

$$(7.2) \sigma^W : \Omega_{2j+1}^{U, G \times S^1}[\mathcal{F}_{i+1}, \mathcal{F}_i](X) \longrightarrow \Omega_{2j+3}^{U, G \times S^1}[\mathcal{F}_{i+1}, \mathcal{F}_i]((DW, SW) \times X),$$

can be regarded via Proposition 4.2 as a direct sum of suspension maps

$$\Omega_{2l+1}^{U, G \times S^1}[\mathcal{F}_1](Y) \longrightarrow \Omega_{2l+3}^{U, G \times S^1}[\mathcal{F}_1]((DW, SW) \times Y),$$

where $Y = X^{\mathbb{Z}_{i+1}} \times BU(P, G \times S^1)$ for some partition P of $2(j-l)$ and we think of W as a representation of $G \times (S^1/\mathbb{Z}_{i+1}) \cong G \times S^1$. Thus it follows from the case $i = 1$ that (7.2) is a split monomorphism of MU_* -modules in this case.

For the second case consider a $(G \times S^1, \mathbb{Z}_{i+1})$ -partition $P = (p_V)_{V \in \mathcal{C}_{G \times S^1, \mathbb{Z}_{i+1}}}$ of an even integer k . Let $P' = (p'_V)_{V \in \mathcal{C}_{G \times S^1}}$ denote the $(G \times S^1, \mathbb{Z}_{i+1})$ -partition of $k+2$ defined by

$$p'_V = \begin{cases} p_V + 1 & \text{if } V = W \\ p_V & \text{otherwise.} \end{cases}$$

Since $W^{\mathbb{Z}_{i+1}} = \{0\}$, Proposition 4.2 implies that the map (7.2) can be interpreted as a direct sum of maps of the form

$$\psi : \Omega_{2l+1}^{U, G \times S^1}[\mathcal{F}_1](X^{\mathbb{Z}_{i+1}} \times BU(P, G)) \longrightarrow \Omega_{2l+3}^{U, G \times S^1}[\mathcal{F}_1](X^{\mathbb{Z}_{i+1}} \times BU(P', G))$$

induced by addition of ε_C to the multiplicity bundle corresponding to the V in the decomposition. We know already that maps of this kind are split monomorphisms of MU_* -modules, and we conclude that (7.2) is always a split monomorphism of MU_* -modules.

Now the following diagram with exact columns implies inductively that, for all i , σ^W is a split monomorphism of MU_* -modules on $\Omega_*^{U, G \times S^1}[\mathcal{F}_i](X)$.

$$\begin{array}{ccc} 0 & & 0 \\ \downarrow & & \downarrow \\ \Omega_{2j+1}^{U, G \times S^1}[\mathcal{F}_i](X) & \xrightarrow{\sigma^W} & \Omega_{2j+3}^{U, G \times S^1}[\mathcal{F}_i]((DW, SW) \times X) \\ \downarrow & & \downarrow \\ \Omega_{2j+1}^{U, G \times S^1}[\mathcal{F}_{i+1}](X) & \xrightarrow{\sigma^W} & \Omega_{2j+3}^{U, G \times S^1}[\mathcal{F}_{i+1}]((DW, SW) \times X) \\ \downarrow & & \downarrow \\ \Omega_{2j+1}^{U, G \times S^1}[\mathcal{F}_{i+1}, \mathcal{F}_i](X) & \xrightarrow{\sigma^W} & \Omega_{2j+3}^{U, G \times S^1}[\mathcal{F}_{i+1}, \mathcal{F}_i]((DW, SW) \times X) \\ \downarrow & & \downarrow \\ 0 & & 0 \end{array}$$

Finally, to prove (4) of Theorem 7.1, let $f : M \longrightarrow X$ represent an element of $\Omega_*^{U, G \times S^1}[\mathcal{F}_i](X)$, $i > 1$, and suppose that we have already proved that

$$\Omega_*^{U, G \times S^1}[\mathcal{F}_j](X) \longrightarrow \Omega_*^{U, G \times S^1}(X)$$

is zero for all $j < i$. We shall construct a bordism with no isotropy restrictions from f to a map $f' : M' \rightarrow X$ where M' is an \mathcal{F}_{i-1} -manifold. By the induction hypothesis, this will complete the proof.

Let us pause for a moment to explain informally how the bordism will be constructed. The idea is based on a standard technique in geometric topology known as “attaching handles”. Any sphere S^k is the boundary of a disc D^{k+1} ; if $S^k \subset N^n$ is embedded with trivial normal bundle in a manifold N and has a tubular neighborhood T , we can obtain a bordism of N to a new manifold by crossing N with the unit interval and pasting $D^{k+1} \times D^{n-k-1}$ (a *handle with core D^k*) to $N \times I$ by identifying $T \times \{1\}$ with $S^k \times D^{n-k-1}$. Our construction will be basically “attaching a generalized handle” to our manifold M . Instead of an embedded sphere, we shall use $M^{\mathbb{Z}_i}$, which bounds a manifold W ; this will be the “core” of our “handle”. The “handle” itself will be the total space of a disc bundle over W . The total space of its restriction to $M^{\mathbb{Z}_i}$ will be equivariantly diffeomorphic to a tubular neighborhood of $M^{\mathbb{Z}_i}$ in M , so we may take $M \times I$ and glue the “handle” in the obvious way, thus obtaining the desired bordism. Of course, all the required properties of the bordism have to be checked, and an extension of f to the bordism has to be constructed. We give the details next.

Consider a tubular neighborhood T of $M^{\mathbb{Z}_i}$, regarded as the total space of a disc bundle over $M^{\mathbb{Z}_i}$. We shall use the notation ST for the corresponding unit circle bundle, and T° for $T - ST$. We remark that $M - T^\circ$ and ST are \mathcal{F}_{i-1} -manifolds. When there is no danger of confusion, we shall make no notational distinction between a bundle and its total space.

Let λ denote a generator of $\mathbb{Z}_i \subset S^1 \subset \mathbb{C}$, and let V_k , $0 < k < i$, be 1-dimensional representations of \mathbb{Z}_i such that λ acts by multiplication by λ^k . These form a complete, non-redundant set of nontrivial irreducible representations, and each of the V_k ’s obviously extends to $G \times S^1$ (an element $(g, s) \in G \times S^1$ acts by multiplication by s^k). We use these to obtain an isotypical decomposition of T . Let T_k denote the bundle $\text{Hom}_{\mathbb{Z}_i}(\varepsilon_{V_k}, T)$.

Since $M^{\mathbb{Z}_i}$ is (S^1/\mathbb{Z}_i) -free, our proof in the case $i = 1$ shows that $f|_{M^{\mathbb{Z}_i}}$ bounds a map $\tilde{f} : W \rightarrow X$, where W is the total space of a \mathbb{Z}_i -trivial 1-dimensional $(G \times S^1)$ -disc bundle over $Z = M^{\mathbb{Z}_i}/(S^1/\mathbb{Z}_i)$ whose unit circle bundle is $M^{\mathbb{Z}_i}$.

Passage to orbits gives a pull-back diagram

$$\begin{array}{ccc} T_k & \longrightarrow & T_k/(S^1/\mathbb{Z}_i) \\ \downarrow & & \downarrow \\ N & \longrightarrow & N/(S^1/\mathbb{Z}_i), \end{array}$$

for each k , where the right vertical arrow is a G -disc bundle, which may also be thought of as a $(G \times (S^1/\mathbb{Z}_i))$ -bundle with trivial (S^1/\mathbb{Z}_i) -action. This makes the diagram above a pull-back of $(G \times (S^1/\mathbb{Z}_i))$ -vector bundles. Since the zero-section of this bundle can be identified with $Z = SW/(S^1/\mathbb{Z}_i)$, we have a diagram

of $(G \times (S^1/\mathbb{Z}_i))$ -bundles

$$\begin{array}{ccc}
 T_k & \xrightarrow{\quad} & T_k/(S^1/\mathbb{Z}_i) \\
 \downarrow & \searrow & \downarrow \\
 & p^*(T_k/(S^1/\mathbb{Z}_i)) & \\
 \downarrow & \downarrow & \downarrow \\
 N & \xrightarrow{\quad} & N/(S^1/\mathbb{Z}_i) \\
 \searrow i & & \nearrow p \\
 & W &
 \end{array}$$

Clearly the bundle $\hat{T} = \bigoplus_k p^*(T_k/(S^1/\mathbb{Z}_i)) \otimes \varepsilon_{V_k}$ extends T to W ; we claim that its unit sphere bundle is an \mathcal{F}_{i-1} -manifold. To prove this, observe that

$$W - Z \cong M^{\mathbb{Z}_i} \times [0, 1),$$

where $[0, 1)$ has trivial action, and so $S\hat{T}|_{W-Z}$ is equivariantly homeomorphic to $S\hat{T}|_{W-Z} \times [0, 1)$. Therefore, S^1 -stabilizers of points in $S\hat{T} - ST$ not already present in ST can only appear in $S\hat{T}|_Z$, but since there is no component associated to the trivial representation (recall our remark in the course of the proof of Proposition 4.2) all these are *proper* subgroups of \mathbb{Z}_i , so the claim follows.

Let

$$M' \cong (M - T^\circ) \cup_{ST} S\hat{T};$$

by construction, this is an \mathcal{F}_{i-1} -manifold. Since $T \cup W$ is a $(G \times S^1)$ -deformation retract of \hat{T} , there is a map $\hat{f} : W \rightarrow X$ with $\hat{f}|_T = f|_T$ and $\hat{f}|_W = \tilde{f}$. We obtain a bordism by crossing M with the closed unit interval, pasting \hat{T} to $M \times \{1\}$ along $T \times \{1\}$, and extending f in the obvious way to a map F from the bordism into X . The maps $f' = F|_{M'}$ and f represent the same element in the bordism of X with no isotropy restrictions, as required. \square

8. Passing from G to $G \times S^1$ and $G \times \mathbb{Z}_k$

To complete the proofs of our theorems, it suffices to prove the following result, in which we again assume that we have proven Theorems 5.1 – 5.4 for G .

THEOREM 8.1. *Let $C = S^1$ or $C = \mathbb{Z}_k$. The following statements hold.*

- (1) $\Omega_*^{U, G \times C}(X)$ is a free MU_* -module concentrated in even degrees.
- (2) The map

$$\psi : \Omega_*^{U, G \times C}(BU(n, G \times S^1) \times X) \longrightarrow \Omega_*^{U, G \times C}(BU(n+1, G \times S^1) \times X)$$

is a split monomorphism of MU_* -modules.

- (3) If W is an irreducible complex $(G \times C)$ -module, then

$$\sigma^W : \Omega_*^{U, G \times C}(X) \longrightarrow \Omega_{*+2}^{U, G \times C}((DW, SW) \times X)$$

is a split monomorphism of MU_* -modules.

We first show that $\Omega_*^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X)$ is a free MU_* -module concentrated in even degrees and that σ^W and ψ here are split monomorphisms of MU_* -modules. By Proposition 4.2, we have

$$\Omega_n^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X) \cong \bigoplus_{\substack{0 \leq 2k \leq n \\ P \in \mathcal{P}(2k, G \times S^1, S^1)}} \Omega_{n-2k}^{U,G}(X^{S^1} \times BU(P, G)).$$

Thus, by the induction hypothesis, $\Omega_n^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X)$ is free over MU_* and concentrated in even degrees, and the maps ψ induced by addition of ε_C are split monomorphisms of MU_* -modules.

Theorem 7.1(4) implies that the long exact sequence of the pair $(\mathcal{A}, \mathcal{F}_\infty)$ breaks into short exact sequences. In particular, the map

$$\Omega_*^{U,G \times S^1}(X) \longrightarrow \Omega_*^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X)$$

is a monomorphism, hence $\Omega_*^{U,G \times S^1}(X)$ is concentrated in even degrees.

In order to study the effect of σ^W on $\Omega_n^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X)$, it is necessary to distinguish two cases:

- (1) $W^{S^1} = W$ and
- (2) $W^{S^1} = \{0\}$.

The analysis is similar to the one carried out in the previous section and will be omitted; it yields the expected conclusion: σ^W is a split monomorphism of MU_* -modules on $\Omega_n^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X)$.

The diagram with exact columns

$$\begin{array}{ccc} 0 & & 0 \\ \downarrow & & \downarrow \\ \Omega_{2j}^{U,G \times S^1}(X) & \xrightarrow{\sigma^W} & \Omega_{2j+2}^{U,G \times S^1}((DW, SW) \times X) \\ \downarrow & & \downarrow \\ \Omega_{2j}^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X) & \xrightarrow{\sigma^W} & \Omega_{2j+2}^{U,G \times S^1}[\mathcal{A}, \mathcal{F}_\infty]((DW, SW) \times X) \\ \downarrow & & \downarrow \\ \Omega_{2j-1}^{U,G \times S^1}[\mathcal{F}_\infty](X) & \xrightarrow{\sigma^W} & \Omega_{2j+1}^{U,G \times S^1}[\mathcal{F}_\infty]((DW, SW) \times X) \\ \downarrow & & \downarrow \\ 0 & & 0 \end{array}$$

together with Lemmas 6.2 and 6.3 shows that $\Omega_*^{U,G \times S^1}(X)$ is projective, and therefore free, and σ^W is a split monomorphism of MU_* -modules on $\Omega_*^{U,G \times S^1}(X)$. A similar diagram gives the corresponding conclusion for ψ .

This completes the proof of Theorem 8.1 for $C = S^1$, and it remains to deal with the case $C = \mathbb{Z}_k$. Let V denote the 1-dimensional complex representation of

$G \times S^1$ on which G acts trivially and an element $e^{2\pi it} \in S^1$ acts by multiplication by $e^{2\pi itk}$. Since S^1 acts without fixed points on $SV \times X$,

$$\Omega_*^{U, G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](SV \times X) = 0.$$

Therefore, by the long exact sequence of the pair (DV, SV) ,

$$\Omega_*^{U, G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X) \longrightarrow \Omega_*^{U, G \times S^1}[\mathcal{A}, \mathcal{F}_\infty]((DV, SV) \times X)$$

is an isomorphism, and, by the long exact sequence of the pair $(\mathcal{A}, \mathcal{F}_\infty)$,

$$\Omega_*^{U, G \times S^1}[\mathcal{F}_\infty](SV \times X) \longrightarrow \Omega_*^{U, G \times S^1}(SV \times X)$$

is an isomorphism.

By Theorem 7.1, we conclude that $\Omega_*^{U, G \times S^1}(SV \times X)$ is a free MU_* -module concentrated in odd degrees. This being so, the long exact sequence of the pair (DV, SV) breaks up into short exact sequences

$$0 \longrightarrow \Omega_{2j}^{U, G \times S^1}(X) \xrightarrow{\alpha} \Omega_{2j}^{U, G \times S^1}((DV, SV) \times X) \longrightarrow \Omega_{2j-1}^{U, G \times S^1}(SV \times X) \longrightarrow 0.$$

Since SV can be identified with S^1/\mathbb{Z}_k , we conclude from Lemma 3.4 that

$$\Omega_*^{U, G \times \mathbb{Z}_k}(X) \cong \text{coker } \alpha.$$

Now apply the Snake Lemma to the diagram with exact columns

$$\begin{array}{ccc} 0 & & 0 \\ \downarrow & & \downarrow \\ \Omega_{2j}^{U, G \times S^1}(X) & \xrightarrow{\alpha} & \Omega_{2j}^{U, G \times S^1}((DV, SV) \times X) \\ \downarrow & & \downarrow \\ \Omega_{2j}^{U, G \times S^1}[\mathcal{A}, \mathcal{F}_\infty](X) & \xrightarrow{\cong} & \Omega_{2j}^{U, G \times S^1}[\mathcal{A}, \mathcal{F}_\infty]((DV, SV) \times X) \\ \downarrow & & \downarrow \\ \Omega_{2j-1}^{U, G \times S^1}[\mathcal{F}_\infty](X) & \xrightarrow{\beta} & \Omega_{2j-1}^{U, G \times S^1}[\mathcal{F}_\infty]((DV, SV) \times X) \\ \downarrow & & \downarrow \\ 0 & & 0. \end{array}$$

Since α is a monomorphism and β is an epimorphism, we see that $\text{coker } \alpha \cong \ker \beta$. Since $\ker \beta$ is a free MU_* -module concentrated in odd degrees, $\Omega_*^{U, G \times \mathbb{Z}_k}(X)$ is free and concentrated in even degrees.

To show that σ^W is a split monomorphism, let $Y = (DW, SW) \times X$ and consider the maps

$$\alpha' : \Omega_{2j+2}^{U, G \times S^1}(Y) \longrightarrow \Omega_{2j+2}^{U, G \times S^1}((DV, SV) \times Y)$$

and

$$\beta' : \Omega_{2j+1}^{U, G \times S^1}[\mathcal{F}_\infty](Y) \longrightarrow \Omega_{2j+1}^{U, G \times S^1}[\mathcal{F}_\infty]((DV, SV) \times Y)$$

that fit into the diagram obtained from the previous one by raising all degrees by two and replacing X by Y . Then σ^W induces a map from the original diagram to the new diagram, and there results a commutative square

$$\begin{array}{ccc} \operatorname{coker} \alpha & \xrightarrow{\sigma^W} & \operatorname{coker} \alpha' \\ \cong \downarrow & & \downarrow \cong \\ \ker \beta & \xrightarrow{\sigma^W} & \ker \beta'. \end{array}$$

By Lemma 6.2, the bottom arrow is a split monomorphism of MU_* -modules, hence so is the top arrow. The proof that ψ is a split monomorphism is similar.

 - free, 262
 - sphere, 262
- solvable compact Lie group, 185
- Spanier-Whitehead S -category, 122
- Spanier-Whitehead duality, 174, 266
- spectrification functor, 113, 114
- spectrum, 113
 - G -CW, 123
 - G -cell, 123
 - coordinate free, 114
 - fixed point, 164
 - geometric fixed point, 166
 - indexed on $\{0\}$, 116

- indexed on U , 114
 - orbit, 164
 - tame, 126
 - underlying nonequivariant, 163
- Ω -spectrum, 113
- split G -spectrum, 165
- split as a module, 294
- split as an algebra, 294
- stable coefficient system, 85
- stable element, 199
- stable homotopy limit problem, 233
- stable isomorphism of bundles, 143
- stable manifold, 157
- stable map, 81
- stable orbit category, 84
- stably almost complex manifold, 334
 - tangentially, 337
- strongly dualizable, 173
- sufficiently large ideal, 316
- Sullivan conjecture, 67
- support
 - of a prime in $A(G)$, 220
 - of a prime in $R(G)$, 145
- suspension map, 104
- suspension prespectrum, 117
- suspension spectrum, 117

- tame spectrum, 126
- tangential complex bordism, 337
- Tate G -spectrum, 233
- Tate cohomology, 231, 233
- Tate-Swan cohomology, 234
- tensor and cotensored category
 - of R -modules, 265
 - of R -algebras, 272
 - of commutative R -algebras, 272
- Thom G -prespectrum, 156
- Thom G -spectrum, 156
- Thom class, 157, 335
- Thom complex, 83
- Thom isomorphism, 177, 307, 336
 - in K_G -theory, 146
 - in bordism, 157
- Thom prespectrum, 154
- Thom spectrum, 154, 225, 270
- topological cyclic homology, 244
- topological Hochschild cohomology, 278
- topological Hochschild homology, 278
- Tor, 265, 266
- totalization, 42
- totally disconnected, 183
- transfer map, 83, 179, 192
 - dimension shifting, 192
- transversality
 - failure of, 156
- twisted function spectrum, 247, 255
- twisted half-smash product, 247, 255, 284

- $\mathrm{Un}(M)$, 37
- universal \mathcal{F} -space, 45
- universal coefficient spectral sequence, 19, 266
- universal $(\Pi; \Gamma)$ -bundle, 60
- universe, 81
 - complete, 81
 - trivial, 81
- untwisting isomorphism, 248

- V -Burnside category, 103
- V -connected, 92, 99
- Vec_G , 29
- V -equivalence, 92
- V -Mackey functor, 103
- von Neumann regular ring, 187

- weak equivalence, 12
 - of G -spaces, 12
 - of G -spectra, 121
 - of diagrams, 49
 - of spectra, 116
- weak Hausdorff, 11
- weak map of spectra, 127
- Weyl group, 11
- Whitehead theorem
 - for G -spaces, 14, 93
 - for G -spectra, 123
 - for diagrams, 51
 - via geometric fixed point spectra, 171
- Wirthmüller isomorphism, 168
- wreath product, 320

Selected Titles in This Series

(Continued from the front of this publication)

- 55 **William Arveson**, Ten lectures on operator algebras, 1984
- 54 **William Fulton**, Introduction to intersection theory in algebraic geometry, 1984
- 53 **Wilhelm Klingenberg**, Closed geodesics on Riemannian manifolds, 1983
- 52 **Tsit-Yuen Lam**, Orderings, valuations and quadratic forms, 1983
- 51 **Masamichi Takesaki**, Structure of factors and automorphism groups, 1983
- 50 **James Eells and Luc Lemaire**, Selected topics in harmonic maps, 1983
- 49 **John M. Franks**, Homology and dynamical systems, 1982
- 48 **W. Stephen Wilson**, Brown-Peterson homology: an introduction and sampler, 1982
- 47 **Jack K. Hale**, Topics in dynamic bifurcation theory, 1981.
- 46 **Edward G. Effros**, Dimensions and C^* -algebras, 1981
- 45 **Ronald L. Graham**, Rudiments of Ramsey theory, 1981
- 44 **Phillip A. Griffiths**, An introduction to the theory of special divisors on algebraic curves, 1980
- 43 **William Jaco**, Lectures on three-manifold topology, 1980
- 42 **Jean Dieudonné**, Special functions and linear representations of Lie groups, 1980
- 41 **D. J. Newman**, Approximation with rational functions, 1979
- 40 **Jean Mawhin**, Topological degree methods in nonlinear boundary value problems, 1979
- 39 **George Lusztig**, Representations of finite Chevalley groups, 1978
- 38 **Charles Conley**, Isolated invariant sets and the Morse index, 1978
- 37 **Masayoshi Nagata**, Polynomial rings and affine spaces, 1978
- 36 **Carl M. Pearcy**, Some recent developments in operator theory, 1978
- 35 **R. Bowen**, On Axiom A diffeomorphisms, 1978
- 34 **L. Auslander**, Lecture notes on nil-theta functions, 1977
- 33 **G. Glauber**, Factorizations in local subgroups of finite groups, 1977
- 32 **W. M. Schmidt**, Small fractional parts of polynomials, 1977
- 31 **R. R. Coifman and G. Weiss**, Transference methods in analysis, 1977
- 30 **A. Pełczyński**, Banach spaces of analytic functions and absolutely summing operators, 1977
- 29 **A. Weinstein**, Lectures on symplectic manifolds, 1977
- 28 **T. A. Chapman**, Lectures on Hilbert cube manifolds, 1976
- 27 **H. Blaine Lawson, Jr.**, The quantitative theory of foliations, 1977
- 26 **I. Reiner**, Class groups and Picard groups of group rings and orders, 1976
- 25 **K. W. Gruenberg**, Relation modules of finite groups, 1976
- 24 **M. Hochster**, Topics in the homological theory of modules over commutative rings, 1975
- 23 **M. E. Rudin**, Lectures on set theoretic topology, 1975
- 22 **O. T. O'Meara**, Lectures on linear groups, 1974
- 21 **W. Stoll**, Holomorphic functions of finite order in several complex variables, 1974
- 20 **H. Bass**, Introduction to some methods of algebraic K -theory, 1974
- 19 **B. Sz. Nagy**, Unitary dilations of Hilbert space operators and related topics, 1974
- 18 **A. Friedman**, Differential games, 1974
- 17 **L. Nirenberg**, Lectures on linear partial differential equations, 1973
- 16 **J. L. Taylor**, Measure algebras, 1973
- 15 **R. G. Douglas**, Banach algebra techniques in the theory of Toeplitz operators, 1973
- 14 **S. Helgason**, Analysis on Lie groups and homogeneous spaces, 1972
- 13 **M. Rabin**, Automata on infinite objects and Church's problem, 1972
